

Project Proposal

Initial Draft

Weight: 10% of First Quarter Grade

Project Output:

1. Project Proposal Document (PDF file uploaded to GitHub Repository)
2. GitHub Repository with initial project structure

General instructions: Create an initial project proposal that addresses a real-world problem. Demonstrate how you can apply computational thinking to plan a possible solution to a problem, and describe how your program will work.

****You are not required to complete the actual program. Pls focus on developing a clear, realistic, and well-planned project idea. Coordinate with your classmates to avoid duplication of solutions. Additionally, this is not a group project. This project is to be done individually.*

Parts of your Project Proposal

I. Project Title

Create a clear, concise, and creative title that reflects the problem your project aims to address.

II. Problem Statement

Explain the real-world problem your project wants to solve. Describe the problem clearly, who is affected, and why the problem is important or worth solving.

III. Project Objectives

What do you want your project to achieve? Write some simple, realistic goals. Follow the SMART(Specific, Measurable, Attainable, Realistic, Time-bound) guidelines in writing objectives.

****at most 3 objectives.*

IV. Planned Features

List the main things your project will be able to do.

V. Planned Inputs and Outputs

What will the user do or give (inputs)? What will the system show, do, or give back (outputs)?

Coding in a Connected World: Development of Computational Thinking Skills

QUARTER 1

VI. Logic Plan

This section is about how your project will work behind the scenes - the logic or steps your program will follow.

Choose only one way to present your logic for now:

A. Pseudocode

Write the steps of your program using plain English or structured phrases. It doesn't need to be real code, just a clear explanation of what the program will do, step by step.

OR

B. Flowchart

Draw a simple flowchart to show the sequence of actions or decisions in your program. Use basic shapes like arrows, diamonds (for decisions), and rectangles (for processes) to map out the flow.

SUBMISSION via GOOGLE CLASSROOM

GitHub Repository Link

Paste the link to your project's GitHub repository here. Make sure it's public and includes:

- Your draft proposal (this document),

- A basic README.md file that introduces your project,

- At least one initial commit (a saved version of your work).
